Format requirements- RDTII data collection practice.pdf(~754 KB) Singapore, Malaysia, Australia, Legal Inventory.csv(~116 KB)

Dear Participants,

We recently received a query regarding the formatting of our database. The dataset shared for the Round 1 (3) countries is the master dataset that was collected and recorded manually. While we follow strict formatting guidelines, you may still notice some inconsistencies despite our data-cleaning efforts. To support your work, we are sharing our formatting requirements and guidelines (attached), which may be useful for any additional data-cleaning activities you undertake. This document was also provided for Assignment that is due this Friday.

We were also asked whether we could provide a dataset that more closely resembles the expected output format of your automated tools, where each Act/Regulation is recorded as a unique observation, and the Impact column is presented in a cleaner format. Unfortunately, we do not maintain such a dataset, and the master dataset previously shared remains the closest available version.

That said, for our Tableau dashboard visualizations, we generate a long-form dataset in which each Act/Regulation is treated as a unique observation. This long form dataset is a subset of the master dataset and is the same as the government portal sample dataset but with information for all pillars. It is attached to the email and also available in the "Sample Kit" Folder in the knowledge portal.

Please note that this dataset has several limitations:

- It does not contain an Impact column explaining why the Act/Practice is relevant.
- Some regulations and related information may differ from, or be missing compared to, the master dataset.
- It does not include key information on the relevant sections, articles and provisions that support the coding.

If you choose to use this long-form dataset as a reference point, any additional evidence or missing information identified by your tool may be classified as "NEW" evidence.

However, we recommend using the previously shared master dataset as your primary point of reference, as it remains the most complete and authoritative source. The long-form dataset should be treated as a secondary reference and used mainly for purposes such as data structuring, formatting, or validating outputs generated by your automated tools.

If you have any questions, please email them to us before 15th June so we can address them during the Q&A Session.

Hope this helps. Happy coding and see you on 11th June.

Best,
ESCAP Hackathon Team
