

End-user perspective

What to consider to achieve a useful outcome?

To start with: Framing the Mindset

Methodology comes first!

What is the **main aim** of your research? Formulate it clearly and simply in one sentence. If you need 5 minutes to explain the main aim, think again!

Importance of **benchmark**: What are we assessing against?
Understand the benchmark – thoroughly!

Benchmark & Norms

International Treaty vs International best practice. Example of different types of norms: shall, shall not, no Party shall, shall endeavour, recognize, may, should... Consider: "For greater certainty", "to the extent practicable", "Definitions"...

Universe of Laws

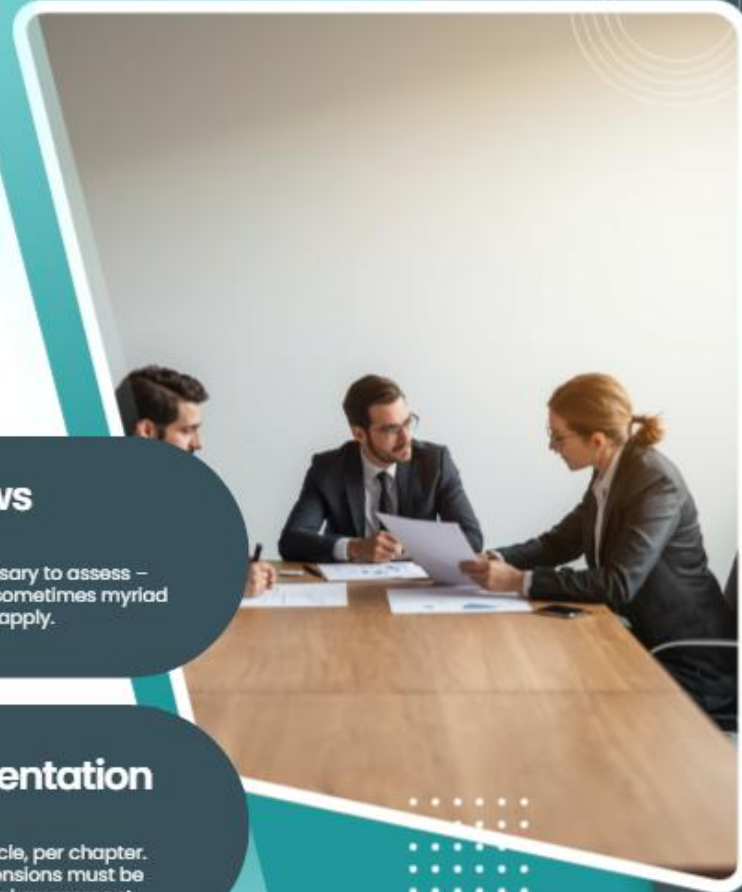

Understanding the universe of laws necessary to assess – sometimes a single law should be enough, sometimes myriad of sectoral laws and guidelines apply.

Compliance vs Alignment

Differences in approaches depending on the benchmark.
Compliance vs alignment vs...?

Exceptions & Implementation

The issue of exceptions – general, per article, per chapter.
What about implementation? These dimensions must be clearly scoped before beginning any legal assessment.

Difficulties

Key challenges encountered during legal research and assessment processes (non-exhaustive and of course, depending on the project at hand)

Legal & Structural

- Different legal systems – civil law vs common law.
- Different institutional structure.
- Web of webpages – no single point of entry for laws/regulations.

Operational

- Lack of data.
- Language barriers: old laws in ENG, new laws are not; only main laws are translated, guidelines etc. are not.
- If cooperation with the authorities is envisaged – slow response from the authorities.
- If AI tools are used, a lot of time is spent on tweaking the prompts.

What is needed for the AI tools to be useful?

Below are the key requirements identified for AI tools to become genuinely useful in legal and regulatory research contexts.

Law Identification & Links

Better automatic identification of relevant laws with relevant links. Sometimes links are broken or are to the wrong webpages.

Translation & Legal Terminology

Better translation of legal and technical terminology. Understanding connections between different legal provisions potentially in different pieces of legislation. E.g. data privacy exclusion found in consumer protection law.

Prompt Efficiency & Comparative Analysis

Better results with simpler prompts. Able to run the same prompt across different jurisdictions and give comparative analysis. Less hallucination.

References & Source Accuracy

Better references to the exact paragraphs of the legislation where the information is coming from. Ensuring accuracy and traceability of all cited legal sources.

Can we at all understand the implementation only through desk research/use of AI tools?
